

Week Report 2

Notes 2

Lab 2

Debian Dekstop

The screenshot shows a virtual machine desktop environment. The background is a dark blue abstract wallpaper. In the foreground, there is a web browser window displaying the cis106 website. The browser has multiple tabs open, including 'cis106/notes/notes2 at m...', 'cis106/labs/lab2/lab2.m...', and 'Week Report 2 | Linux Funda...'. The website content includes a sidebar with navigation links for 'Linux Fundamentals', 'MODULES', 'WEEK_REPORT', 'LABS', 'DOCUMENTATION', and 'GUIDES'. The main content area is titled '4. Submission for Week Report 2' and contains a 'Note' section and a list of instructions. A terminal window is open in the bottom left corner, showing the command prompt 'CIS106' and the file 'wr2.md'.

Linux Fundamentals

Welcome to the course

MODULES

- Module 1 What is Linux?
- Module 2 Using Debian
- Module 3 Administration

WEEK_REPORT

- Week Report 1
- Week Report 2

LABS

- Lab 1 - Learning Markdown
- Lab 2 - Installing Debian 13

DOCUMENTATION

- Cd .! vs cd -
- Frequently Asked Questions
- How do I practice the stuff I am learning in this class?
- How to Ask for Help on Slack
- Learning Git
- Markdown Cheat Sheet
- VM Test Activity

GUIDES

- Colored Man Pages
- Customize Edit
- FORMAT control characters

4. Submission for Week Report 2

Note:
Since you already completed Lab 2, the remaining coursework for this class will be completed inside the virtual machine. Windows/macOS will not be used for the remainder of the course. **PLEASE DO NOT EDIT OR UPLOAD FILES THROUGH THE GITHUB WEBSITE.** You must use the VS Code terminal to commit and push changes to your repository. If you ignore this requirement, troubleshooting will be your responsibility. If you don't understand, please ask! This report can only be completed after Lab 2!

- If you have not done so, create a folder inside the `weekReports` folder called `wr2`. You probably did this already during Lab 2.
- Open the `cis106` folder in VS Code
- Inside the `wr2` folder, create a file called `wr2.md`
- Add a link to your notes and Lab 2 Markdown files in your GitHub repository..
- Add a screenshot of your Debian desktop with either a terminal window open or Firefox displaying the cis106.com website.
- Add a screenshot of your Discussion Board reply
- Convert the `wr2.md` file to PDF
- Push all the changes to GitHub
- In Blackboard, submit the URL to the `wr2.md` file and the PDF file `wr2.pdf`

5. Week Report Grading

Item	Points
Your GitHub repository is properly organized	25pts
Debian Desktop screenshot	25pts
Discussion Board reply screenshot	25pts
Proper markdown syntax	25pts

6. Notes Grading

Item	Points
------	--------

Discussion Post & Response

Taylor Capers

3 minutes ago, at 4:19 PM

In my opinion, the most significant event in Linux history for my field of study was Linux becoming widely used as a server OS in the late 1990s and early 2000s. This is important to me because I am studying CIS with a focus on web and mobile development, while also considering a career in cloud administration, security, or cloud architecture. As the internet grew, businesses began needing more servers to host websites, manage databases, and support their online services. Linux became popular in this area because businesses could use a flexible and affordable operating system instead of relying on expensive physical systems. Linux's ability to support multiple processors also helped it move further into the server environment and improve its scalability. This history is important to my career goals because modern cloud environments still rely heavily on Linux for servers and other infrastructure. Red Hat's discussion of Linux also shows how the technology eventually moved from the server room into the cloud, including Microsoft's decision to support Linux virtual machines through Azure.

I agree that Linux being released as open source was a major turning point because it allowed developers and users to see and work with the source code. I also think the shift from desktop computers to server infrastructure is especially important because it helped establish Linux as a foundation for modern computing. As someone interested in cloud administration and cybersecurity, I can see how that flexibility continues to make Linux valuable for managing systems.
